1. INTRODUCTION

Overview

FSC-BT691 is Bluetooth Low Energy (BLE) 5.1 Module. integrating a 2.4 GHz transceiver and an ARM® Cortex-M0+TM microcontroller with a RAM of 48 kB and a One-Time Programmable (OTP) memory of 32 kB.

It can be used as a standalone application processor or as a data pump in hosted systems.

Very low active RF, MCU current and low-power mode current consumption provide excellent battery lifetime and allow for operation on small coin cell batteries and in energy-harvesting applications.

The BLE firmware includes the L2CAP service layer protocols, Security Manager (SM), Attribute Protocol (ATT), the Generic Attribute Profile (GATT), and the Generic Access Profile (GAP). All profiles published by the Bluetooth® SIG as well as custom profiles are supported.

The device is suitable for disposables, wireless sensor nodes, beacons, proximity tags and trackers, smart HID devices (stylus, keyboards, mice, and trackpads), toys, and medical and industrial applications.

Features

- 2.4-GHz RF Transceiver Compatible With Bluetooth Low Energy (BLE) 5.1
- Supports up to three BLE connections
- Typical cold boot to radio active 35 ms
- 16 MHz 32-bit ARM® Cortex-M0+ with SWD interface
- Dedicated Link Layer Processor
- AES-128 Encryption Processor
- 32 kB One-Time-Programmable (OTP)
- 48 kB Retainable System RAM

- 144 kB ROM
- Clock-less hibernation mode: 270 nA
- 10-bit ADC for battery voltage monitoring
- Built-in temperature sensor for die temperature monitoring
- TX: 3.5 mA, RX: 2.2 mA (system currents with DC-DC, VBAT_HIGH =3 V and 0 dBm)
- Programmable transmit output power from -19.5 dBm to +2.5 dBm
- -94 dBm receiver sensitivity
- Support SPI, UART, I2C interface
- Support the OTA upgrade
- Wide Operating Voltage Range:1.65V to 3.6V
- Operating Temperature: -40°C to +85°C

Application

- Medical applications
- Disposables
- Beacons
- Proximity tags and trackers
- Smartwatches
- Human interface devices (HID)
- Industrial appliances

2. General Specification

Table 1: General Specifications

| Categories | Features | Implementation |
|--------------------------------|----------------------|--|
| Wireless Specification | Bluetooth Version | Bluetooth Low Energy 5.1 |
| | Frequency | 2.400 - 2.483.5 GHz |
| | Transmit Power | -19.5 dBm to +2.5 dBm |
| | Receive Sensitivity | -94 dBm (Typical) |
| | Modulation | GFSK |
| Host Interface and Peripherals | UART Interface | TX, RX, CTS, RTS General Purpose I/O Default 115200,N,8,1 Baudrate support from 1200 to 921600 5, 6, 7, 8 data bit character |
| | GPIO | 6 (maximum – configurable) lines Pull-up resistor (33 KΩ) control |
| | I2C Interface | Read pin-level |
| | ADC Interface | 2 (configurable from GPIO total). Up to 400 kbps Analog input voltage range: 0.4V ~ 1.4V(or 2.4V) based on configure Supports single 10-bit SAR ADC conversion |
| | PWM | 2 channels (configured from GPIO total) Up to 200MSPS conversion 2 PWM outputs Supports edge-alignment or center-alignment Supports fault detection |
| Profiles | Class Bluetooth | No Support |
| | Bluetooth Low Energy | GATT Client & Peripheral - Any Custom Services |
| Maximum Connections | Classic Bluetooth | Supports up to three BLE connections |
| FW upgrade | Supply | J-Link |
| Wide Supply Voltage | Supply | 1.65V ~ 3.6V |
| Power Consumption | | 1.6uA (Sleep) |
| Physical | Dimensions | 15.2mm X 15.2mm X 2mm; Pad Pitch 0.8mm |
| Environmental | Operating | -40°C to +85°C |
| | Storage | -50°C to +150°C |
| Miscellaneous | Lead Free | Lead-free and RoHS compliant |
| | Warranty | One Year |
| Humidity | | 10% ~ 90% non-condensing |
| MSL grade: | | MSL 3 |
| ESD grade: | Human Body Model | ±2000V |
| | Charged Device Model | ±2500V |

| 19 | GND | Vss | Power Ground | |
| 20 | RF | O | RF signal output . | |

4. PHYSICAL INTERFACE

4.1 Power Supply

The transient response of the regulator is important. If the power rails of the module are supplied from an external

voltage source, the transient response of any regulator used should be $20\mu\text{s}$ or less. It is essential that the power rail recovers quickly.

4.2 Reset

Comprises a reset (RST) pad which is active high. It contains an RC filter with a resistor of $65\text{ k}\Omega$ and a capacitor of 3.5 pF to suppress spikes. It also contains a $25\text{ k}\Omega$ pull-down resistor. This pad should be driven externally by a field-effect transistor (FET) or a single button connected to VBAT. The typical latency of the RST pad is in the range of $2\text{ }\mu\text{s}$.

4.3 General Purpose Analog IO

The FSC-BT691 is equipped with a high-speed ultra-low-power 10-bit general purpose Analog-to-Digital Converter (GPADC). It can operate in unipolar (single ended) mode as well as in bipolar (differential) mode. The ADC has its own voltage regulator (LDO) of 0.9 V , which represents the full-scale reference voltage.

- 10-bit dynamic ADC with 125 ns typical conversion time
- Maximum sampling rate 1 Msample/s
- $128\times$ averaging; conversion time 1 ms , up to 11b ENOB
- Ultra-low power ($20\text{ }\mu\text{A}$ typical supply current at 100 ksample/s)
- Two single-ended or two differential external input channels (GPIOs)
- Battery, DCDC outputs, and the internal VDD monitoring channels
- Chopper function
- Offset adjust
- Common-mode input level adjust
- Configurable attenuator: $1x$, $2x$, $3x$ and $4x$
- Input shifter

4.4 General Purpose Digital IO

There are 6 general purpose digital IOs defined in the module. All these GPIOs can be configured by software to realize various functions, such as button controls, LED drives or interrupt signals to host controller, etc. Do not connect them if not use.

The I/O type of each I/O pins can be configured by software individually as Input or Push-pull output mode. After the chip is reset, the I/O mode of all pins is input mode with no pull-up and pull-down enable. Each I/O pin has an individual pull-up and pull-down resistor which is about $30\text{ k}\Omega \sim 50\text{ k}\Omega$ for VDD and Vss.

4.5 RF Interface

The Radio Transceiver implements the RF part of the BLE protocol. Together with the Bluetooth 5.1 PHY layer, it provides up to 93 dB RF link budget for a reliable wireless communication. All RF blocks are supplied by on-chip low-drop out-regulators (LDOs). The bias scheme is programmable per block and optimized for minimum power consumption.

- Single ended RFIO interface, 50Ω matched
- Alignment free operation
- -94 dBm receiver sensitivity

- Configurable transmit output power from -19.5 dBm up to 2.5 dBm
- Ultra-low power consumption
- Fast frequency tuning minimizes overhead

4.6 Serial Interfaces

4.6.1 UART

FSC-BT691 provides one channels of Universal Asynchronous Receiver/Transmitters (UART)(Full-duplex asynchronous communications). The UART Controller performs a serial-to-parallel conversion on data received from the peripheral and a parallel-to-serial conversion on data transmitted from the CPU.

This is a standard UART interface for communicating with other serial devices. The UART interface provides a simple mechanism for communicating with other serial devices using the RS232 protocol.

When the module is connected to another digital device, UART_RX and UART_TX transfer data between the two devices. The remaining two signals, UART_CTS and UART_RTS, can be used to implement RS232 hardware flow control where both are active low indicators.

This module output is at 3.3V CMOS logic levels (tracks VCC). Level conversion must be added to interface with an RS-232 level compliant interface.

Some serial implementations link CTS and RTS to remove the need for handshaking. We do not recommend linking CTS and RTS except for testing and prototyping. If these pins are linked and the host sends data when the FSC-BT691 deasserts its RTS signal, there is significant risk that internal receive buffers will overflow, which could lead to an internal processor crash. This drops the connection and may require a power cycle to reset the module. We recommend that you adhere to the correct CTS/RTS handshaking protocol for proper operation.

Table 3: Possible UART Settings

| Parameter | Possible Values |
|---------------------|-------------------|
| Baudrate | Minimum |
| | Standard |
| | Maximum |
| Flow control | RTS/CTS, or None |
| Parity | None, Odd or Even |
| Number of stop bits | 1 /1.5/2 |
| Bits per channel | 5/6/7/8 |

When connecting the module to a host, please make sure to follow .

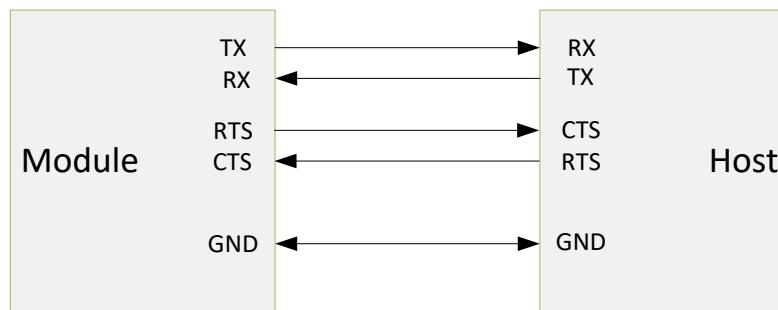

Figure 4: UART Connection

4.6.2 I²C Interface

The I²C Interface is a programmable control bus that provides support for the communications link between Integrated Circuits in a system. It is a simple two-wire bus with a software-defined protocol for system control, which is used in temperature sensors and voltage level translators to EEPROMs, general-purpose I/O, and A/D and D/A converters.

- Two-wire I²C serial interface consisting of a serial data line (SDA) and a serial clock (SCL)
- Clock synchronization
- 32 locations deep transmit/receive FIFOs (32× 8-bit Rx and 32× 10-bit Tx)
- Master transmit and Master receive operation
- Slave transmit and Slave receive operation
- 7-bit or 10-bit addressing
- 7-bit or 10-bit combined format transfers
- Bulk transmit mode
- Default slave address of 0x055
- Interrupt or polled-mode operation
- Handles bit and byte waiting at both bus speeds
- Programmable SDA hold time
- DMA support

5. ELECTRICAL CHARACTERISTICS

5.1 Absolute Maximum Ratings

Absolute maximum ratings for supply voltage and voltages on digital and analogue pins of the module are listed below. Exceeding these values causes permanent damage.

The average PIO pin output current is defined as the average current value flowing through any one of the corresponding pins for a 100mS period. The total average PIO pin output current is defined as the average current value flowing through all of the corresponding pins for a 100mS period. The maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.

Table 4: Absolute Maximum Rating

| Symbol | Description | Min | Trp | Max | Unit |
|--------|-----------------------|------|-----|-------|------|
| VDD | BT Input voltage | -0.2 | - | 3.6 | V |
| VI | Input voltage | -0.2 | - | 3.6 | V |
| VO | Output voltage | VSS | - | VDD_H | V |
| TOP | Operating Temperature | -40 | - | 85 | °C |
| TSTG | Storage Temperature | -50 | - | 150 | °C |

Note: Exceeding one or more of the limiting values may cause permanent damage to FSC-BT691.

Caution: Electrostatic sensitive device, comply with protection rules when operating.

5.2 DC Electrical Characteristics

Table 5: Voltage and current

| Symbol | Parameter | Min | Type | Max | Unit | Test Conditions |
|----------------------------------|-------------------------------|---------|------|---------|------|-----------------|
| V _{DD} -V _{SS} | DC Power Supply | 1.8 | | 3.3 | V | TA=25°C |
| T _A | Operating Temperature | -40 | 25 | +85 | °C | - |
| I ₁ | Standby Current in Sleep mode | - | 1.6 | - | uA | 48K+RCX |
| VOH | Output high level voltage | VDD-0.3 | - | VDD | V | - |
| VOL | Output low level voltage | VSS | - | VSS+0.3 | V | - |
| VIH | Input high level voltage | 1.8 | - | 3.3 | V | - |
| VIL | Input low level voltage | VSS | - | VSS+0.3 | V | - |

5.3 AC Electrical Characteristics

Table 6: RF

| Symbol | Parameter | Min | Type | Max | Unit |
|--------------------------|---|-------|------|--------|------|
| General frequency | | | | | |
| Fop | Operating frequency | 2400 | - | 2483.5 | MHz |
| N _{CH} | number of channels | - | 40 | - | 1 |
| Transmitter | | | | | |
| PRF | Output power | -19.5 | - | 2.5 | dBm |
| PBW | 20dB Bandwidth for Modulated Carrier at 1Mbps | - | 1.5 | - | MHz |
| Receiver | | | | | |
| RXSENS | Sensitivity (0.1%BER) @1Mbps | - | -94 | - | dBm |

6. MSL & ESD

Table 7: MSL and ESD

| Parameter | Value |
|------------|--|
| MSL grade: | MSL 3 |
| ESD grade: | Human Body Model Charged Device Model |
| | ±2000V ±2500V |

7. RECOMMENDED TEMPERATURE REFLOW PROFILE

Prior to any reflow, it is important to ensure the modules were packaged to prevent moisture absorption. New packages contain desiccant (to absorb moisture) and a humidity indicator card to display the level maintained during storage and shipment. If directed to bake units on the card, please check the Picture below and follow instructions specified by IPC/JEDEC J-STD-033.

Note: The shipping tray cannot be heated above 65°C. If baking is required at the higher temperatures displayed in the Picture below, the modules must be removed from the shipping tray.

Any modules not manufactured before exceeding their floor life should be re-packaged with fresh desiccant and a new humidity indicator card. Floor life for MSL (Moisture Sensitivity Level) 3 devices is 168 hours in ambient environment 30°C/60%RH.

Table 8: Recommended baking times and temperatures

| MSL | 125°C Baking Temp. | | 90°C/≤ 5%RH Baking Temp. | | 40°C/≤ 5%RH Baking Temp. | |
|-----|----------------------|--|--------------------------|--|--------------------------|--|
| | Saturated @ 30°C/85% | Floor Life Limit + 72 hours @ 30°C/60% | Saturated @ 30°C/85% | Floor Life Limit + 72 hours @ 30°C/60% | Saturated @ 30°C/85% | Floor Life Limit + 72 hours @ 30°C/60% |
| 3 | 9 hours | 7 hours | 33 hours | 23 hours | 13 days | 9 days |

Feasycom surface mount modules are designed to be easily manufactured, including reflow soldering to a PCB. Ultimately it is the responsibility of the customer to choose the appropriate solder paste and to ensure oven temperatures during reflow meet the requirements of the solder paste. Feasycom surface mount modules conform to J-STD-020D1 standards for reflow temperatures.

The soldering profile depends on various parameters necessitating a set up for each application. The data here is given only for guidance on solder reflow.

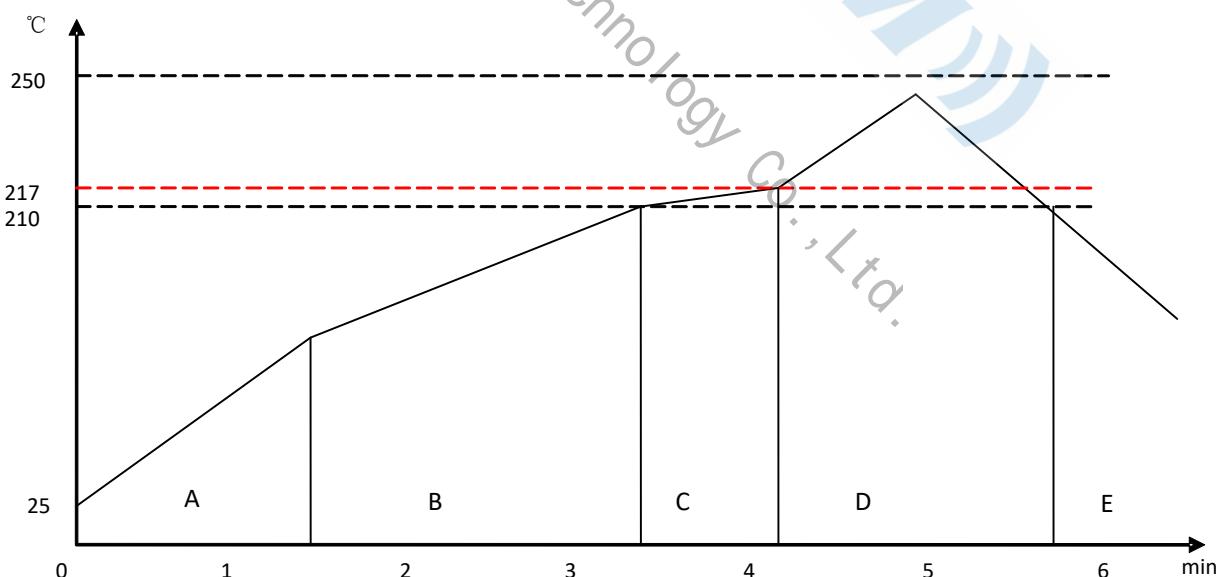

Figure 5: Typical Lead-free Re-flow

Pre-heat zone (A) — This zone raises the temperature at a controlled rate, typically 0.5 – 2 °C/s. The purpose of this zone is to preheat the PCB board and components to 120 ~ 150 °C. This stage is required to distribute the heat uniformly to the PCB board and completely remove solvent to reduce the heat shock to components.

Equilibrium Zone 1 (B) — In this stage the flux becomes soft and uniformly encapsulates solder particles and spread over

PCB board, preventing them from being re-oxidized. Also with elevation of temperature and liquefaction of flux, each activator and rosin get activated and start eliminating oxide film formed on the surface of each solder particle and PCB board. **The temperature is recommended to be 150° to 210° for 60 to 120 second for this zone.**

Equilibrium Zone 2 (C) (optional) — In order to resolve the upright component issue, it is recommended to keep the temperature in 210 – 217 ° for about 20 to 30 second.

Reflow Zone (D) — The profile in the figure is designed for Sn/Ag3.0/Cu0.5. It can be a reference for other lead-free solder. The peak temperature should be high enough to achieve good wetting but not so high as to cause component discoloration or damage. Excessive soldering time can lead to intermetallic growth which can result in a brittle joint. The recommended peak temperature (T_p) is 230 ~ 250 °C. The soldering time should be 30 to 90 second when the temperature is above 217 °C.

Cooling Zone (E) — The cooling ate should be fast, to keep the solder grains small which will give a longer-lasting joint. Typical cooling rate should be 4 °C.

8. MECHANICAL DETAILS

8.1 Mechanical Details

- Dimension: 10mm(W) x 11.9mm(L) x 2 mm(H) Tolerance: ±0.2mm
- Module size: 10mm X 11.9mm Tolerance: ±0.2mm
- Pad size: 0.9mmX0.6mm Tolerance: ±0.1mm
- Pad pitch: 1.1mm Tolerance: ±0.1mm

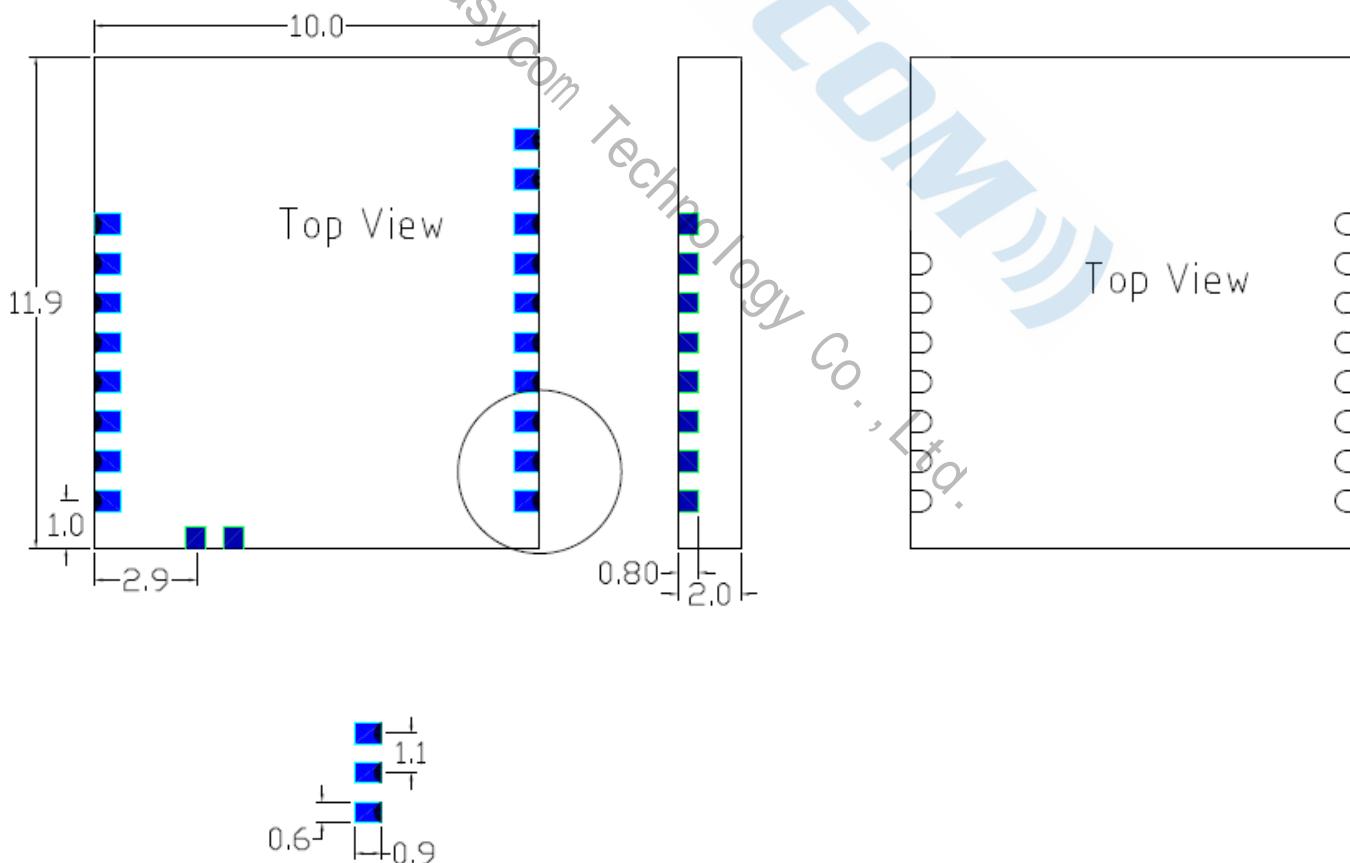

Figure 6: FSC-BT691 footprint

9. HARDWARE INTEGRATION SUGGESTIONS

9.1 Soldering Recommendations

FSC-BT691 is compatible with industrial standard reflow profile for Pb-free solders. The reflow profile used is dependent on the thermal mass of the entire populated PCB, heat transfer efficiency of the oven and particular type of solder paste used. Consult the datasheet of particular solder paste for profile configurations.

Feasycom will give following recommendations for soldering the module to ensure reliable solder joint and operation of the module after soldering. Since the profile used is process and layout dependent, the optimum profile should be studied case by case. Thus following recommendation should be taken as a starting point guide.

9.2 Layout Guidelines (Internal Antenna)

It is strongly recommended to use good layout practices to ensure proper operation of the module. Placing copper or any metal near antenna deteriorates its operation by having effect on the matching properties. Metal shield around the antenna will prevent the radiation and thus metal case should not be used with the module. Use grounding vias separated max 3 mm apart at the edge of grounding areas to prevent RF penetrating inside the PCB and causing an unintentional resonator. Use GND vias all around the PCB edges.

The mother board should have no bare conductors or vias in this restricted area, because it is not covered by stop mask print. Also no copper (planes, traces or vias) are allowed in this area, because of mismatching the on-board antenna.

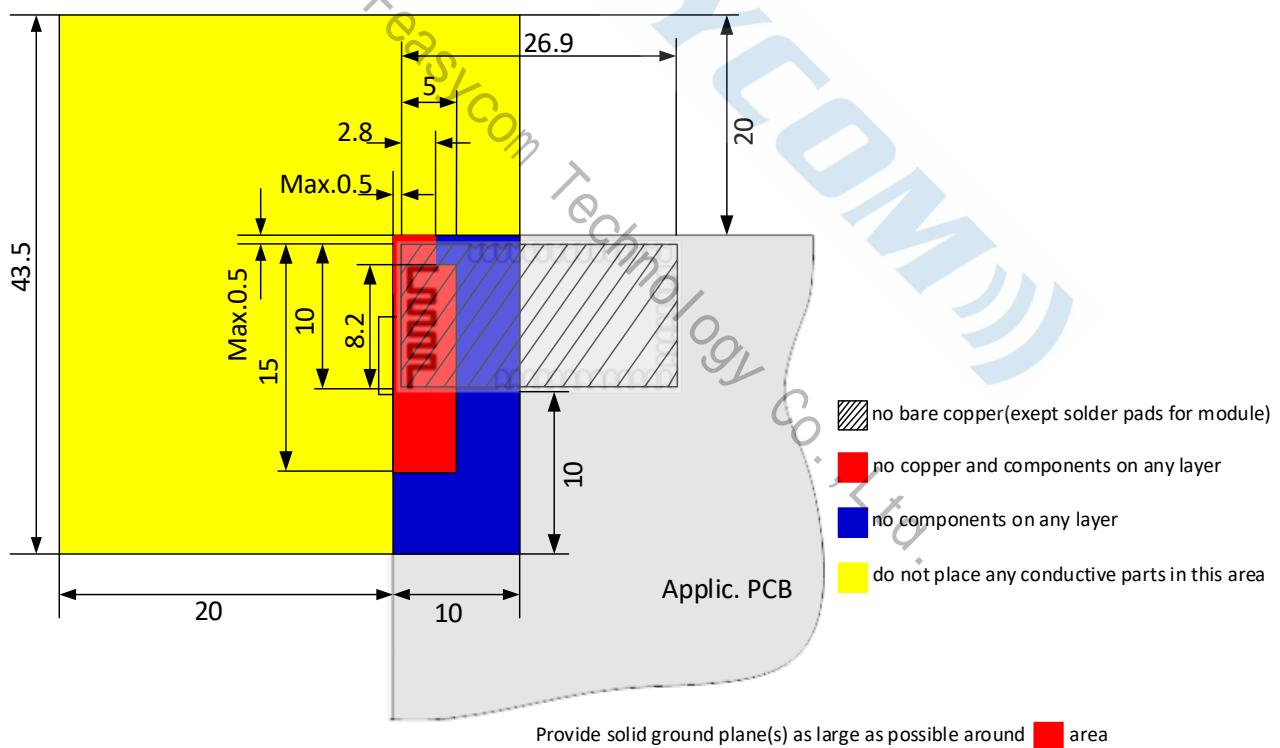

Figure 7: Restricted Area (Design schematic, for reference only. Unit: mm)

Following recommendations helps to avoid EMC problems arising in the design. Note that each design is unique and the following list do not consider all basic design rules such as avoiding capacitive coupling between signal lines. Following list is aimed to avoid EMC problems caused by RF part of the module. Use good consideration to avoid problems arising from digital signals in the design.

Ensure that signal lines have return paths as short as possible. For example if a signal goes to an inner layer through a via, always use ground vias around it. Locate them tightly and symmetrically around the signal vias. Routing of any sensitive

signals should be done in the inner layers of the PCB. Sensitive traces should have a ground area above and under the line. If this is not possible, make sure that the return path is short by other means (for example using a ground line next to the signal line).

9.3 Layout Guidelines(External Antenna)

Placement and PCB layout are critical to optimize the performances of a module without on-board antenna designs. The trace from the antenna port of the module to an external antenna should be 50Ω and must be as short as possible to avoid any interference into the transceiver of the module. The location of the external antenna and RF-IN port of the module should be kept away from any noise sources and digital traces. A matching network might be needed in between the external antenna and RF-IN port to better match the impedance to minimize the return loss.

As indicated in picture below, RF critical circuits of the module should be clearly separated from any digital circuits on the system board. All RF circuits in the module are close to the antenna port. The module, then, should be placed in this way that module digital part towards your digital section of the system PCB.

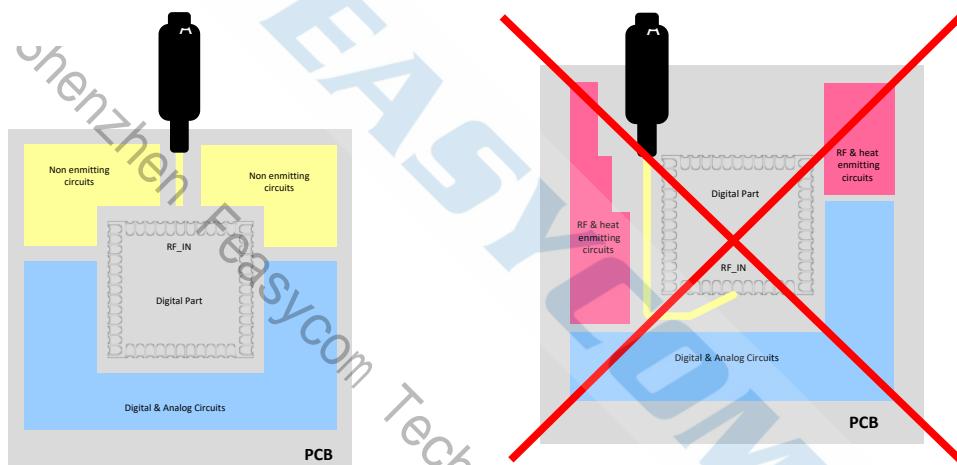

Figure 8: Placement the Module on a System Board

9.3.1 Antenna Connection and Grounding Plane Design

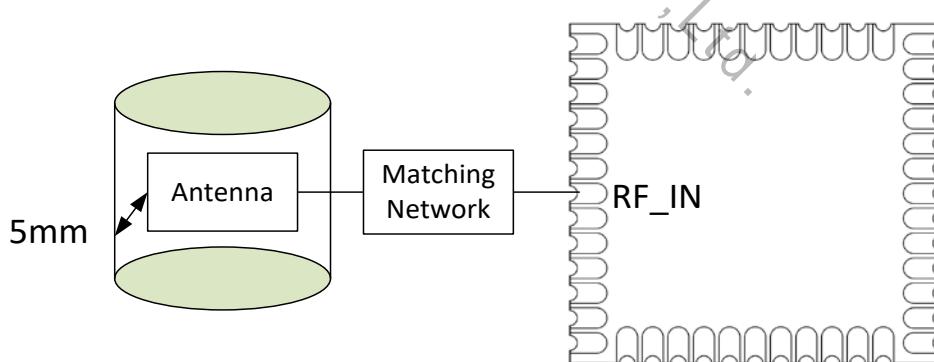

Figure 9: Leave 5mm Clearance Space from the Antenna

General design recommendations are:

- The length of the trace or connection line should be kept as short as possible.

- Distance between connection and ground area on the top layer should at least be as large as the dielectric thickness.
- Routing the RF close to digital sections of the system board should be avoided.
- To reduce signal reflections, sharp angles in the routing of the micro strip line should be avoided. Chamfers or fillets are preferred for rectangular routing; 45-degree routing is preferred over Manhattan style 90-degree routing.

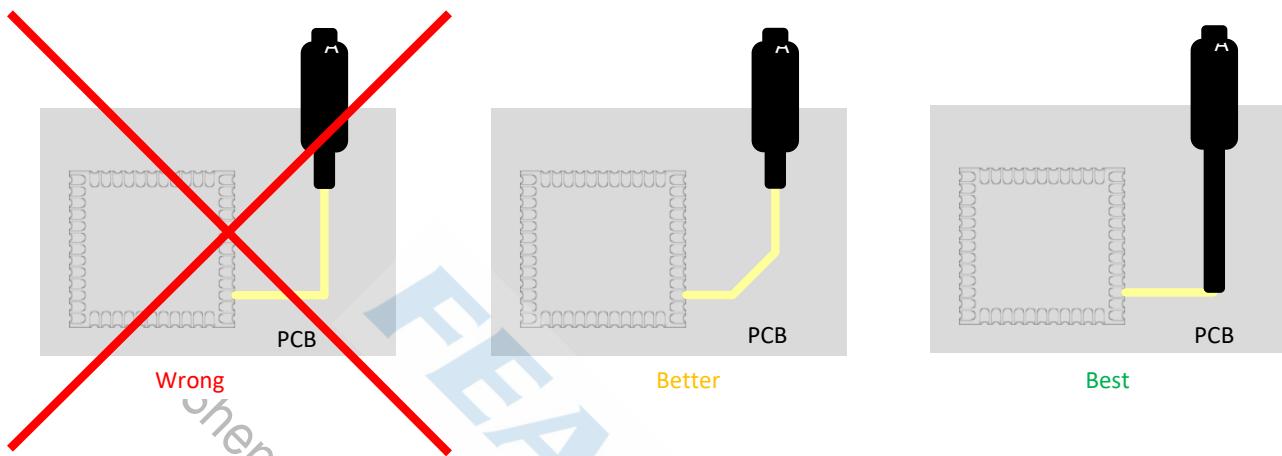

Figure 10: Recommended Trace Connects Antenna and the Module

- Routing of the RF-connection underneath the module should be avoided. The distance of the micro strip line to the ground plane on the bottom side of the receiver is very small and has huge tolerances. Therefore, the impedance of this part of the trace cannot be controlled.
- Use as many vias as possible to connect the ground planes.

Certification of equipment means only that the equipment has met the requirements of the above-noted specification. Licence applications, where applicable to use certified equipment, are acted on accordingly by the ISED issuing office and will depend on the existing radio environment, service and location of operation. This certificate is issued on condition that the holder complies and will continue to comply with the requirements and procedures issued by ISED. The equipment for which this certificate is issued shall not be manufactured, imported, distributed, leased, offered for sale or sold unless the equipment complies with the applicable technical specifications and procedures issued by ISED.

La certification du matériel signifie seulement que le matériel a satisfait aux exigences de la norme indiquée ci-dessus. Les demandes de licences nécessaires pour l'utilisation du matériel certifié sont traitées en conséquence par le bureau de délivrance d'ISED et dépendent des conditions radio ambiantes, du service et de l'emplacement d'exploitation. Le présent certificat est délivré à la condition que le titulaire satisfasse et continue de satisfaire aux exigences et aux procédures d'ISED. Le matériel à l'égard duquel le présent certificat est délivré ne doit pas être fabriqué, importé, distribué, loué, mis en vente ou vendu à moins d'être conforme aux procédures et aux spécifications techniques applicables publiées par ISDE.
